

1 design

Instantaneous

ARTES is able to generate a 3D mesh instantaneously, whenever the geometry is updated.

2 mesh

automatic

fully customized

ARTES reduces the meshing bottleneck by seamlessly integrating geometry and mesh generation, enabling rapid exploration of different design configurations

Far-field + surface normal mesh

The mesh cells are automatically created normal to both the surface of the object, and the far-field.

Automatic shock adaptation

Inherited from the NSMB solver, ARTES provides an automatic adaptation of the mesh grid to the shock during calculation. Once the shock starts to stand out from the original grid, upstream cells are moved towards the shock to refine the area.

This process allows the solver to calculate a very precise shock layer.

3 simulation

built for hypersonic

ARTES leverages the validated NSMB (Navier–Stokes Multi-Block) CFD solver to deliver accurate and reliable results, while enabling efficient and automated CFD workflows.

4 processing

straightforward

Integrated post-processing tools enable seamless analysis and visualization of CFD results, accelerating the transition from simulation to insight.
